

Tape to Cloud

For long term retention data residing upon tapes, it can be smart to put this into the cloud to enable safe, secure hosting of the data without a need to maintain the hardware infrastructure, including space and support costs.

That's the easy part - the important things to get right, tested and clear before you move the data are:

- I'm getting a low cost per GB for storage, but am I storing data I *don't* need to pay for?
- The data is infrequently or never required, but if I do need to identify the data and extract it how will this work?
- Putting data in the cloud can be cost effective, but am I going to be gouged when it comes to pulling the data out
 - What are the egress base costs?
 - How does the cloud service billing systems get triggered and how do I minimize them?

We have the answers, and we have the solutions.

- Data remediation expertise and capability at the time of ingestion
- Creation and use of tape backup session container files to enable specific data categories be organized and easy to manage once ingested
- Use of VM's with proprietary software that enables processing work through VTL's in the cloud

Let's talk through your need and create the right process for your situation.
